

. Competitive Landscape

Synthesized from gathered competitor data (drone-in-a-box sub-research + counter-UAS/consolidation findings). Public figures cited where available; unverifiable items flagged **UNVERIFIED**. **Baseline:** ONDS ~\$. . . B market cap (June), FY revenue \$. M, ~ M shares.

. Autonomous drones / drone-in-a-box (vs Optimus & American Robotics Scout)

Company	Public?	Scale	DIB?	vs Ondas
Skydio	Private	\$. M Series F (Apr) at \$. B; ~\$ M rev; ~\$. B bookings (%+ defense); \$. M US Army X D order	Yes (Dock for X)	Strongest, best-capitalized DIB rival; edge in onboard AI autonomy + US defense/public-safety dominance
Percepto	Private	~\$ M raised (\$ M Series C,); ~\$ M rev (est.)	Yes (AIM / Air Max / Base)	Closest industrial-inspection analog; mature, BVLOS-waivered
Nightingale Security	Effectively private (NGL delisted Aug)	~\$. M raised	Yes (Blackbird + Base)	Most direct fixed-site security/DFR head-to-head, but tiny/capital-constrained
Easy Aerial	Private	~\$. M raised; USAF/CBP/DHS contracts	Yes (SAMS, incl. tethered)	Defense/border-weighted; far smaller
Azur Drones	Private	~\$. M raised; ~€ . M FY turnover (contracting)	Yes (Skeyetech)	European security-DIB analog, much-reduced scale

Public drone peers (market cap / TTM rev, ~June ,):

Company	Ticker	TTM Rev	Market Cap	True DIB?
---	---	---	---	---
AeroVironment	AVAV	\$. B	~\$. B	No (tactical/loitering UAS; post-BlueHalo)
Red Cat	RCAT	\$. M	~\$. B	No (man-portable recon UAS)
Unusual Machines	UMAC	\$. M	~\$. B	No (components/picks-and-shovels)
Draganfly	DPRO	\$. M	~\$ M	Partial (via Nightingale partnership)
ZenaTech	ZENA	\$. M	~\$ M	Partial (IQ Nano, indoor auto-dock)

Read: Ondas's closest product rival (Skydio) is private at \$. B; the public names are mostly NOT drone-in-a-box (AVAV is a tactical-UAS defense large-cap; RCAT/UMAC are recon/components). Ondas sits between AVAV (scale) and the speculative micro-caps, with a genuine **FAA Type Certification / BVLOS regulatory moat** few rivals hold.

. Counter-UAS (vs Iron Drone Raider + Sentrycs) — the marquee battlefield

Company	Verified notes	vs Ondas
---	---	---
Anduril	\$ B post-money (after \$ B Series H, ~May); ~ x the June-\$. B); revenue ~\$. B (mgmt, ~ x YoY; ~\$. B projected); U.S. Army	

enterprise C-UAS contract is a **-yr ceiling up to ~\$ B** (awarded Mar , not obligated \$). **Roadrunner-M** reusable VTOL interceptor (~\$ k-\$ k/unit; "near-zero recovery cost" when no target engaged) | Best-funded, scaled prime; directly competes with Iron Drone kinetic approach + bundles system-of-systems | **DroneShield (ASX: DRO)** | Mkt cap ~A\$. **B** (~US\$. - . B); **FY revenue A\$. M, + % YoY; turned profitable (net profit A\$. M)**; Q ' rev A\$ M; pipeline ~A\$. - . B. RF detection (RfOne) + DroneSentry C + RF jamming/EW (DroneGun) | Public C-UAS benchmark; RF/EW focus vs Ondas's kinetic + cyber-over-RF; now scaled & profitable | **Dedrone (Axon)** | Axon acquired Dedrone; announced May , **closed Oct** ; **value undisclosed** | Airspace-security detection now backed by Axon's scale/channel | **D-Fend Solutions** | **EnforceAir** = RF-cyber takeover, **non-jamming, non-kinetic** (assume control + safe-land) | Direct competitor to **Sentrycs'** non-jamming protocol-takeover approach | **Epirus** | **Leonidas** solid-state high-power-microwave (HPM) anti-swarm; defeated -drone swarm (Aug) | Directed-energy modality ONDS lacks | **Fortem Technologies** | **DroneHunter** radar-guided autonomous **net-capture** interceptor; \$ M U.S. Army contract (Feb); FIFA selection | Closest analog to Iron Drone's net-capture approach | **Perennial Autonomy** | \$ **M C-UAS IDIQ** (JIATF- , May ; reported largest single C-UAS award); Merops interceptors (> , Russian-drone intercepts cited) | Award-scale benchmark; integrated/LSI models favored in procurement |

Read: C-UAS is ONDS's **highest-conviction market** (~ % CAGR), and its **dual modality** (Iron Drone kinetic net-capture + Sentrycs non-jamming protocol takeover) is differentiated and usable in regulated/populated airspace. **But** the field is crowded with far better-capitalized players — Anduril (\$ B, ~\$. B revenue) above all, and a now-profitable DroneShield (A\$ M revenue) as the scaled public pure-play — and procurement increasingly favors scaled lead-system-integrators (e.g., Perennial's \$ M IDIQ).

• Drone inspection (vs Cyberhawk, pending close Q)

Competitors: **Percepto** (AIM), **Flyability** (confined-space), Sky-Futures, Nearmap, plus traditional inspection firms. Cyberhawk's edge is the **iHawk software/data layer** (digital twins, k+ assets, ~ % recurring) — a higher-margin position than hardware-centric inspection rivals. Headroom is large (Cyberhawk ~ . % share of a ~\$ B market) but it's a small incumbent.

• Critical-infrastructure / rail private wireless (vs Ondas Networks FullMAX / t)

Figures verified - - . No standalone rail-segment revenue is publicly broken out for these large private/divisional units — figures intentionally omitted rather than fabricated.

| Company | Role vs Ondas | Verified positioning |

---|---|---

| **Siemens Mobility** | **PARTNER** (not a head-to-head competitor) | Exclusive partnership to sell Siemens-branded "Airlink" radios built on Ondas' s/t SDR to North American rail; joint Head-of-Train, Amtrak **ACES** **MHz** (~\$. M), and European on-loco radio work. Latent systems-level competitor only. |

| **Meteorcomm LLC** | **Incumbent competitor** | The rail industry's interoperable PTC/ITC messaging provider — operates **ITCnet** (MHz). Owned % each by Class I affiliates (BNSF Communications, CSX, NS Spectrum, Ekanet/Union Pacific). |

| **Nokia** | Competitor (adjacent market) | Global rail-comms leader; lead **FRMCS** (G GSM-R successor) vendor; deployed world-first MHz G SA with Deutsche Bahn. |

| **Ericsson** | Competitor (adjacent market) | Active FRMCS G vendor; on the ETSI Railway Communications group defining FRMCS. |

Clarifications: FRMCS (Nokia/Ericsson, G, European/global, GSM-R successor) and AAR (North American freight) are **distinct, non-overlapping markets** — Nokia/Ericsson compete with Ondas mainly in the broader critical-infrastructure private-wireless category and non-US rail, not the AAR dot-freight buildout. The **legacy 900 MHz ATCS network is being retired** (FCC-driven, ~Sept deadline; ~\$100M industry investment), opening the 900 MHz "A-block" where Ondas did its first deployment (Chicago).

Read: Ondas's moat here is real (patented FullMAX embedded in IEEE 802.11p, AAR standard selection, exclusive Siemens channel, software-upgradable installed base) — but this segment is now **deconsolidated** and ~10% of revenue, so it's optionality rather than a core competitive front today.

Where ONDS wins / where it's vulnerable

Wins:

- **Regulatory/certification moat** — first FAA Type Certification (Optimus-EX) + first automated-BVLOS-without-operator approval; hard and slow to replicate.
- **Standards-embedded networking IP** — FullMAX inside IEEE 802.11p with AAR/rail lock-in.
- **Breadth / "system of systems"** — air + ground + C-UAS + stratospheric + AI software via M&A, plus a Palantir tie-in and prime-contractor access (Mistral).
- **Dual-modality C-UAS** usable where jamming is illegal.
- **Emerging data moat** — Cyberhawk's recurring iHawk platform (pending).

Vulnerable:

- **Outgunned on capital/scale** by Anduril (\$1.5B), AVAV+BlueHalo (>\$1.5B rev), Axon-backed Dedrone.
- **Moat increasingly assembled by acquisition**, not organic IP — integration risk.
- **Procurement favors scaled LSIs** over sub-scale point-solution vendors.
- **No clean kinetic-interceptor TAM** — Iron Drone's exact niche is unsized and contested (Anduril Roadrunner).
- **Capital-structure fragility** — serial dilution funds the competitive push; a risk-off turn closes that window.

Method note: Section synthesized by the lead analyst from the competition sub-agent's drone-DIB research plus counter-UAS/consolidation findings. The counter-UAS and rail/networks figures were **independently re-verified** by dedicated verification agents (see "verified" labels above). Key correction from that pass: the earlier "Anduril <\$100k engagement" figure was **wrong** and removed (Roadrunner-M is ~\$100k-\$200k/unit; the sub-\$100k figure belongs to other vendors). DroneShield is now correctly shown as scaled & profitable

(A\$ M FY revenue), and Siemens is clarified as a partner (not competitor) with Meteorcomm as the true rail incumbent.
